Demonstration. Built from synthetic data.

Is Dual moving-average trend (long-only) real, or a lucky backtest?

It looks real, with reservations.

It passes the tests for hidden bias and overfitting, and it survives far higher trading costs. It earned 3.8% a year after costs, behind the benchmark's 5.7%, with less than half of the market's exposure. The evidence for skill is moderate.

0.46
Sharpe after costs, benchmark 0.43

-29%
largest fall

97 bps
break-even cost, 5 assumed

Decisions needed

	DECISION	WHO	BY WHEN
1	Decide whether a lower return with lower exposure fits the mandate	Investment committee	This meeting
2	Trade it on paper for three months before committing capital	Portfolio manager	Next quarter
3	Set the drawdown at which it would be switched off	Risk manager	Before any capital

The evidence is in the report; the tear sheet is for investors; the dashboard tests other costs and sizes.
